

# Safety Solutions Help Separating Walkways From Forklift Traffic at Modexpress in Helmond

## Modexpress, Helmond

### PROTECT PEDESTRIANS AND INFRASTRUCTURE FROM FORKLIFTS

Modexpress aimed to enhance safety in its warehouse by addressing the critical need to separate pedestrian traffic from forklift operations. The dynamic nature of warehouse environments, with both employees on foot and vehicles in motion, posed significant risks of accidents and collisions. To mitigate these risks, Boplan® installed robust safety barriers with integrated handrails at strategic locations throughout the facility. These barriers not only create clear physical separations between pedestrian walkways and forklift zones but also improve visibility and guidance for workers, ensuring safer navigation within the warehouse. By implementing these measures, Modexpress has taken a proactive step toward reducing incidents, improving operational efficiency, and fostering a safer working environment for all its employees.

### CHALLENGE

Modexpress asked Boplan to install safety barriers that prevent pedestrians from easily entering areas where vehicles are operating. We also developed a safety solution for machines. Boplan installed the sturdy TB 260 PLUS safety barrier at various locations around the warehouse. Elsewhere, the TB 400 and KP column protection are the ideal safety solutions to protect critical points in the company's warehouse.

## Impactful Results

As a one-stop shop for safety solutions, Boplan installed protection measures at several locations on the site. After assessing potential impacts, we recommended using the TB 260 PLUS to clearly separate and protect pedestrians from forklift traffic. This safety barrier with integrated handrails provides better visibility and guidance. Pedestrians notice the TB 260 PLUS straight away on entering the workplace and are more careful when traversing certain areas. The robust TB 260 PLUS also protects the fire extinguishers and goods lifts on site. We installed a TB 400 safety barrier to protect the cross braces.

Our safety barriers with handrails are impact-resistant, optimally visible, user-friendly and modular. They provide:

- Safe separation of pedestrian traffic from other traffic flows
- More safety awareness in the workplace
- Protection against unexpected events such as forklift collisions
